

Introduction

This document will show you how to install Android studio and combine it with Github. Everything mentioned in this document presupposes that you have a Windows 10 machine and got Java and the SDK installed.

How to install Android Studio

First of all, you go to this <https://developer.android.com/studio/index.html> website and download the IDE. Then you double click the .exe file and follow the instructions of the installation wizard. After this very hard step you should be able to open Android Studio and everything should work fine.

Installing GitHub

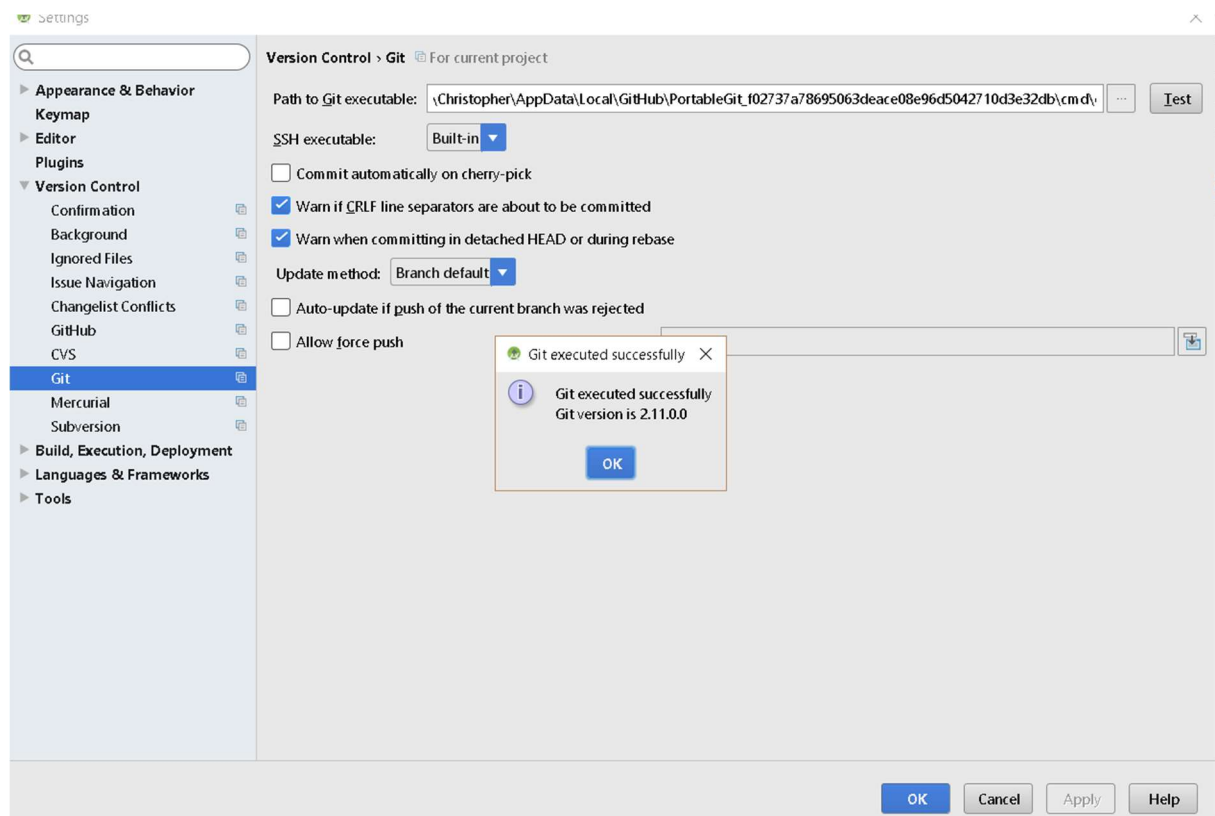

You have to create an account for Github. To do so go to the website: <https://github.com/> and create an account. After that, go to: <https://desktop.github.com/> and download GitHub Desktop. Subsequently, follow the installation wizard. After you have successfully installed GitHub start the application and log in.

Combine Git with Android Studio

You have to locate a file called: git.exe. The path will look like this:

C:\Users\Christopher\AppData\Local\GitHub\PortableGit_f02737a78695063deace08e96d5042710d3e32db\cmd\

After that, start Android studio and goto File->Settings->Git. Then paste your path in and press Test. If everything is correct you get a message like this:

Congratulations, you have successfully installed Android Studio and integrated GitHub.
